For Immediate Release.

2nd February 2004

IKON AVS launch groundbreaking Touch Podule

IKON AVS Ltd, Design & Manufacturers of the award winning PODULE series of multimedia control interfaces, have announced the launch of their eagerly awaited Touch Podule.

The Touch Podule is a highly configurable, yet cost effective, 6.4" colour touch screen controller operating under the IKON AVS proprietary Podflow Software. Construction and ease of programming of the device makes it ideal for use in corporate and commercial applications such as Boardrooms, Lecture Theatres and Voice Alarm Control Stations, as well as easily integrating into Home Automation and Home Theatre environments.

Designed for wall, rack or lectern mounting, the new Touch Podule not only interfaces directly with the existing PODULE range of products via standard Cat 5 cables, but is also fitted as standard with a local RS232/RS485 port, allowing for direct control of third party equipment. Installations requiring multi-screen implementation are also catered for, including full handshaking between devices.

Touch Edit, Touch Podule's intuitive software suite, provides the installer with all the tools necessary to create customised high-resolution user interfaces and control logic to suit a wide spectrum of applications.

David Tyas, Managing Director of IKON AVS comments, "The Touch Podule is something that I have been very keen on developing as an extension of the PODULE product range. It was very important for us to develop a cost effective, but powerful controller that could seamlessly integrate into both simple and complex applications. In addition to this, the Touch Podule now allows installers to specify a comprehensive graphical control interface into applications where before now, budget constraints would have prohibited such use."
